

Polaroid MicroSLR 35mm Camera

This low cost microscope camera is simplicity itself to use and can be interfaced to almost any optical microscope. Its ergonomic design and lightweight construction ensure microscope stability and automatic functions help to deliver consistently good, reliable results in colour or black and white. The camera is easily fitted either to an existing eyepiece tube after removing the eyepiece, or to a trinocular phototube.

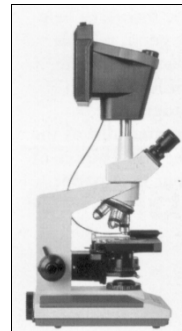

The SLR viewfinder enables the operator to preview the image prior to exposure and ensures accurate framing and focusing. Then simply push the shutter button to display the exposure time and initiate exposure. Finally the picture is ejected from the camera automatically.
