

## Leica Tissue Processor TP1020

The semi-enclosed *benchtop* Leica TP1020 tissue processor is available in four configurations: the basic instrument, the basic instrument with vacuum, the basic instrument with a fume control system and the basic instrument with both vacuum and fume control.

Gentle specimen processing and a high level of specimen safety at all stages of the processing run are supported by the robust design based on precision mechanics in conjunction with a modern user interface.

It is possible to process 100 or 200 cassettes at a time which supports variable workloads and with a proven “workhorse” track record of high reliability this instrument can be used with confidence. It is possible to operate this instrument mechanically during power failures so that specimens can be saved from drying out.

- P558**      Basic instrument
- P558/V**    Basic instrument with vacuum
- P558/FH**   Basic instrument with fume control
- P558/VFH** Basic instrument with vacuum *and* fume control
